

Doctors Take It E-as-y

With the optional TeleForm eForm module, users can complete forms electronically on screen, using an HTML or PDF web form. This removes the need for TeleForm users to have to manually correct handwritten forms whilst speeding up data acquisition and providing a more flexible way for users to complete forms. The only client side requirement is the free Adobe Acrobat Reader, which comes pre-installed on most new PCs and a modern web browser.

The TeleForm Auto Merge Publisher can also be used with eForms to “pre-fill” key data (e.g. personal contact information) on to the form, so that the user only needs to enter the requested specific information.

eForms In Action

ePC have put TeleForm eForms to good use at The Clinical Trials Group (CTG), part of the University College London. The solution is being used to manage the follow up information from patients involved in clinical trials.

Clinical trial patients make regular follow up visits to a doctor who completes feedback forms either electronically or on paper.

If a paper form is completed and posted back to CTG, it is scanned into the TeleForm system, which then checks it for errors. If errors are found, the solution can convert the form into an electronic form and email them back to the doctor for correction. Corrections only take a few seconds adjusting only the incorrect data and then the completed form re-submitted to TeleForm.

The system enables CTG to ensure they get the most from the time of their medical professionals, and that the data feedback is updated in an efficient and timely manner.

“ePC are making a valuable contribution to our aim of running trials in an efficient and cost effective manner.”
