

# Accounts Payable Overview

## Cardiff Intelligent Documents for Accounts Payable

Accounts Payable departments are under constant pressure to reduce costs, and most of those costs are directly attributed to the manual, inefficient methods of processing that take place throughout the entire AP lifecycle, from transporting hard copies of invoices from distributed office locations, to manual preparation and sorting, manual data entry, tracking discounts, and researching payment terms. And according to the International Accounts Payable Professional organization#, labour intensive manual and paper based processes have always been the biggest problem in accounts payable departments.

Because manual processing methods are so error prone and inefficient, they can lead the organization to even greater associated costs that result from issues like duplicate and unauthorized payments, lost documents, missed discounts, compliance fines, late fees and more.

This is why so many organizations today are turning to Cardiff to automate their Accounts Payable processes. By automating not only the manual preparation and data entry steps, but also employing automated business processing rules to ensure best practices are being followed, organizations significantly reduce or eliminate the costs and risks associated with previous processing methods.

### Cardiff Intelligent Documents

For the past 15 years, Cardiff has provided organizations of all sizes, including the Global 2000, the premier solution focused on streamlining and simplifying the

myriad of complex connections between the people, documents and processes that are critical to their businesses. With a flexible architecture and the ability to process both paper documents and online information, the Cardiff solution extends the power of existing business systems in a way that enhances their value and makes them easier for people to work with. The result is smoother processing for both **organizations' customers and staff**, dramatically reducing costs of data entry and offering complete visibility into process status at every point in the cycle.

### Intelligent Document Processing for Accounts Payable

With Cardiff Intelligent Document Processing for Accounts Payable (AP), departments rest assured in knowing they are gaining the highest level of efficiency and accuracy, from data and document capture through post, all the while benefiting from seamless integration into the overall AP process, including real-time access to SAP R/3, Oracle business solutions and all other key AP components for critical validations, postings and more.

## Key Aspects of Cardiff Intelligent Documents for AP

### One Solution for Capturing Paper and Digital Information

By providing the only seamless solution for handling the on-ramping and processing of both electronic and paper-originated invoices into the same AP workflow, the Cardiff Intelligent Document Solution allows organizations to reduce operating costs and accelerate processes. For paper originated invoices, this solution automatically captures, identifies, extracts and validates key data elements from invoices. Once effectively digitized, these images and their data follow the same workflows as their electronically originated counterparts, providing for maximum throughput and efficiency.

### Flexible Document Input Options

For those invoices that enter your organization as paper, whether at distributed locations or submitted directly to corporate, Cardiff offers a variety of capture options, such as fax, email, scanner and web browser. As a result, each employee type in the organisation, from distributed knowledge workers like regional store managers and brokers, to dedicated centralized scanning operators and AP clerks, can submit invoices in a way that best fits into their day to day activities.

# Accounts Payable Overview

## Cost Savings/ROI with Cardiff AP

Automated AP solution implementations will result in annual savings of 60% or more for the average company, with Cardiff customers achieving direct ROI from reduction in transportation and manual data entry costs alone, in a matter of months. The following example of a national U.S. retail chain brings such savings to light.

### The Process

- The AP department processes more than 500,000 invoices annually
- 400,000 entered the organization as paper, mostly from 800+ distributed chain locations, and were transmitted to HQ for manual data entry
- 100,000 were submitted to HQ via electronic data interchange.
- 4 full time clerks manually entered invoice data into Line of Business systems and scanned images for archiving purposes
- Invoices then ran through the rest of the AP process, including reconciliations, payment approvals, submissions and more

### The Costs

- Industry average manual data entry is 6000 characters per hour per clerk
- On average, each invoice had 8-10 fields per invoice requiring manual data entry of a minimum of 9 characters per field
- Each clerk was able to process approximately 500 invoices per day
- Salary and benefits from data entry alone is \$210,000+ per year
- 800 stores would Fedex an invoice package each week at \$15 each
- These total transportation costs far exceed any other expenditure at \$600,000 per year

### The Solution

With the Cardiff AP Solution, this customer was able to realize a full ROI in less than 3 months. This was partly achieved by eliminating all transportation costs associated with sending invoices from distributed offices by utilizing the distributed Web Capture Option for submitting clear, crisp images of the invoices instantly from the stores to HQ for automatic processing. In addition, all AP staff but one clerk was reassigned to other responsibilities in the organization, reducing annual headcount costs attributed to previous AP clerk responsibilities to less than \$50,000 per year.

Indirect costs related to the former, error prone, time inefficient method of manual processing were also significantly reduced due to **Cardiff Intelligent Document's strong** processing capabilities, allowing companies to enforce best practices associated with standard workflows and exception handling procedures.

Process improvements minimized costly errors associated with:

- Duplicate payments
- Unauthorized payments
- Missed discounts
- Late fees

Process improvements decreased costly resource drain associated with:

- Manual preparation & sorting
- Payment creation
- Processing payment authorizations
- Investigating receipt status
- Tracking discounts & outstanding debts
- Researching payment terms

## Detecting Fraudulent Activities\*

Cardiff AP automatically checks and prevents these in real-time:

- Rounded amounts
- Invoice totals just below approval amounts
- Sequential invoice numbers
- Above-average payments per vendor
- Mail drop as an address

## Rapid Understanding

**Identification:** By automating their AP, organisations eliminate manual and error prone steps associated with the identification and sorting of invoices. Manual methods and less robust solutions are simply unacceptable as organizations can have tens of thousands of unique vendors registered in their systems, each with unique format and varying length invoices. Distinguishing between the last page of one invoice and the first page of the next can become extremely time-consuming, especially if this sorting is completed manually or with separator sheets for identification. In addition, any supporting documentation needs to be uniquely handled as well.

**Data Acquisition:** After identifying and sorting each unique invoice type, the Cardiff AP solution will automatically apply all appropriate data acquisition rules, based on document type. This is important because differing invoices have unique requirements and regional data extraction requirements (i.e. European vs. US) will vary as well.

**Validation:** Data is automatically validated against a number of criteria, in real-time, prior to final commit to any line of business systems. This step is critical as the data must be validated as accurate prior to feeding into financial systems to avoid any false assumptions or misinformed business decisions. In addition, any suspect information flagged for review is easily and securely validated from both central & distributed locations via Cardiff's intuitive user interface.

# Accounts Payable Overview

## Features and Benefits

### Capture

- Centralized and distributed offices
- Email, fax, image archive, scanner
- Thin client, intuitive and customizable web-browser interface
- Power feature rich user interfaces

### Identification

- Only handful of rules required to automatically sort and classify 1000s of uniquely formatted invoices
- Single and multi-page invoices, and supporting documents, without the need for dividers like separator sheets or barcodes
- Suite of content-based classification, including full page keyword, rules-based and phrase identification algorithms, image analysis, barcodes and more

### Data Acquisition

- Key data located and extracted regardless of location on page
- Preconfigured regional rules
- Single and multi-page data extraction, including line item details
- Customizable rule set for unique organizational requirements
- Automatically reads machine print (OCR), handprint (ICR), barcodes, and more
- Multi-voting engines for utmost in accuracy of extracted data

### Validation

- Accuracy confidence threshold of paper-to-digital data conversion
- Vendor authorization
- Subtotal and total calculations
- Correspondence to an approved purchase order
- Partial or total PO matching

### Intelligent Processing

- Payment processing authorizations/declinations
- Receipt status investigations
- Track discounts & outstanding debts
- Researching payment terms
- Identifying duplicates
- Real-time interfacing with the financial systems organizations depend on, including SAP R/3, Oracle Financials, and more

### Security, Visibility, Auditability

- Customizable by business process
- Operates seamlessly behind scenes
- Every single keystroke recordable
- Supports internal and external compliance and anti-fraud initiatives
- Data rollup for system-wide AP report

## Intelligent Processing

Cardiff AP provides automatic pre-defined and ad hoc workflow routing, efficiently moving information into the next logical processing step(s). The system supports secure user directed, rules based email routing workflow. Authorization requests can also be routed to multiple users for parallel modifications and approvals.

In a perfect world, all incoming invoices have the same payment terms, valid PO numbers, and are from approved vendors. In addition, line items match items ordered and received, and totals match totals. As a result, these invoices are easily postable for payment. In reality, however, invoices are submitted without PO's, suppliers are not approved, items billed for don't always match items ordered, duplicates are submitted, and payment terms vary widely from. Therefore, managing perfect world scenarios is not enough. Without automated exception and automated workflow routing to efficiently manage the typical, widely variable conditions, organizations suffer massive inefficiencies and errors, resulting in duplicate payments, unauthorized payments, late fees and more. By applying Cardiff's automated, intelligent processing capabilities, these organizations rapidly and cost-effectively manage all of these real-world scenarios.

## Enterprise-Class Rapid Design & Deployment

While most industry solutions may take many months of development before they are production ready, the Cardiff solution for AP is up and running in no time due to its rich, graphically user-friendly

Design Studio interface. Via intuitive point and click functionality, the design studio allows the organization to rapidly automate and embed intelligence into its unique business process rules. For the most complex, unique business rule development requirements, it offers a suite of APIs, accessible via standard industry scripting languages, including JavaScript and VBA.

- Easily decide how and when to on-ramp paper & electronically originated invoices
- Capture and extract data from all variations of invoices with as little as one rule set definition
- Efficiently handle any associated supporting information
- Implement realtime interactions with line of business systems (SAP/Oracle) for data transport and validations
- Rapidly set up approval process and exception handling rules

## Security, Visibility and Auditability

With the Cardiff AP, organizations can easily meet internal and external compliance, security and reporting requirements with complete traceability and accountability. The system can be configured to track every step between people, systems, images, and associated system and data views and manipulations. Information can be reported in real time for in-process activities or stored for historical reviews. Open signing technology allows administrators to restrict access to human and system users based on assignments to business processes, validation activities, image types, data & more.

# Accounts Payable Overview

## About Cardiff

Cardiff is a leading provider of Intelligent Document solutions that enable organizations to unify people, paper and processes. Cardiff enables organizations to capture data from electronic and paper sources and adapt to existing processes by managing structured, exception and people-driven actions. As a result, businesses achieve greater agility, increase customer value and reduce operational costs while shortening deployment time and improving visibility and control of key processes.

Cardiff serves more than 8,000 customers worldwide, including many in the financial services, pharmaceutical, healthcare, education, government and manufacturing industries. Cardiff is an Autonomy Group company (LSE: AU or AU.L).

## Why ePC?

ePartner Consulting Ltd have more experience in implementing Cardiff based data capture solutions than any other UK company. We have implemented all kinds of systems from simple questionnaire processing through to mission critical timesheet capture. We have faced unique challenges from high volume requirements of over 120,000 pages per day through to complicated installation requirements such as our safety card system on four oil platforms in the North Sea.

ePC gained ISO 9001:2000 accreditation in 2005 and believe that this shows our commitment to best practice and encourages us to constantly evaluate and improve our working methods.

Our focus on fully understanding your requirements, offering seasoned advice during the project specification stage and our technical abilities and resources to implement the right solution, all combine to allow us to exceed your expectations.
